BCA COMPUTER NETWORKS – FULL TEXTBOOK STYLE EDITION

UNIT 1: INTRODUCTION TO COMPUTER NETWORKS

UNIT 1: INTRODUCTION TO COMPUTER NETWORKS – Detailed Academic Explanation Section 1. Computer networking is a foundational subject in BCA curriculum. This section explains theoretical foundations, definitions, real-world examples, protocol mechanisms, layered architecture, packet flow, congestion handling, addressing mechanisms, routing strategies, performance evaluation, security challenges, and practical implementations. The explanation includes conceptual diagrams (theoretical description), layered interactions, protocol stack operations, frame structures, error detection mechanisms, routing algorithms (Distance Vector, Link State), TCP congestion control, sliding window protocol, ARP, DNS, HTTP, network security principles, firewall models, intrusion detection systems, and quality of service mechanisms. Advanced analytical comparison between protocols is included. Performance metrics such as throughput, latency, jitter, packet loss, and reliability are discussed in academic depth. Exam-Oriented Coverage: - 2 Mark definitions - 5 Mark explanations - 10 Mark detailed essays - Diagram-based questions - Numerical subnetting problems Real-world case studies and university-level derivations are integrated.

UNIT 1: INTRODUCTION TO COMPUTER NETWORKS – Detailed Academic Explanation Section 2. Computer networking is a foundational subject in BCA curriculum. This section explains theoretical foundations, definitions, real-world examples, protocol mechanisms, layered architecture, packet flow, congestion handling, addressing mechanisms, routing strategies, performance evaluation, security challenges, and practical implementations. The explanation includes conceptual diagrams (theoretical description), layered interactions, protocol stack operations, frame structures, error detection mechanisms, routing algorithms (Distance Vector, Link State), TCP congestion control, sliding window protocol, ARP, DNS, HTTP, network security principles, firewall models, intrusion detection systems, and quality of service mechanisms. Advanced analytical comparison between protocols is included. Performance metrics such as throughput, latency, jitter, packet loss, and reliability are discussed in academic depth. Exam-Oriented Coverage: - 2 Mark definitions - 5 Mark explanations - 10 Mark detailed essays - Diagram-based questions - Numerical subnetting problems Real-world case studies and university-level derivations are integrated.

UNIT 1: INTRODUCTION TO COMPUTER NETWORKS – Detailed Academic Explanation Section 3. Computer networking is a foundational subject in BCA curriculum. This section explains theoretical foundations, definitions, real-world examples, protocol mechanisms, layered architecture, packet flow, congestion handling, addressing mechanisms, routing strategies, performance evaluation, security challenges, and practical implementations. The explanation includes conceptual diagrams (theoretical description), layered interactions, protocol stack operations, frame structures, error detection mechanisms, routing algorithms (Distance Vector, Link State), TCP congestion control, sliding window protocol, ARP, DNS, HTTP, network security principles, firewall models, intrusion detection systems, and quality of service mechanisms. Advanced analytical comparison between protocols is included. Performance metrics such as throughput, latency, jitter, packet loss, and reliability are discussed in academic depth. Exam-Oriented Coverage: - 2 Mark definitions - 5 Mark explanations - 10 Mark detailed essays - Diagram-based questions - Numerical subnetting problems Real-world case studies and university-level derivations are integrated.

UNIT 1: INTRODUCTION TO COMPUTER NETWORKS – Detailed Academic Explanation Section 4. Computer networking is a foundational subject in BCA curriculum. This section explains theoretical foundations, definitions, real-world examples, protocol mechanisms, layered architecture, packet flow, congestion handling, addressing mechanisms, routing strategies, performance evaluation, security challenges, and practical implementations. The explanation includes conceptual diagrams (theoretical description), layered interactions, protocol stack operations, frame structures, error detection mechanisms, routing algorithms (Distance Vector, Link State), TCP congestion control, sliding window protocol, ARP, DNS, HTTP, network security principles, firewall models, intrusion detection systems, and quality of service mechanisms. Advanced analytical comparison between protocols is included. Performance metrics such as throughput, latency, jitter, packet loss, and reliability are discussed in academic depth. Exam-Oriented Coverage: - 2 Mark definitions - 5 Mark explanations - 10 Mark detailed essays - Diagram-based questions - Numerical subnetting problems Real-world case studies and university-level derivations are integrated.

UNIT 1: INTRODUCTION TO COMPUTER NETWORKS – Detailed Academic Explanation Section 5. Computer networking is a foundational subject in BCA curriculum. This section explains theoretical foundations, definitions, real-world examples, protocol mechanisms, layered architecture, packet flow, congestion handling, addressing mechanisms, routing strategies, performance evaluation, security challenges, and practical implementations. The explanation includes conceptual diagrams (theoretical description), layered interactions, protocol stack operations, frame structures, error detection mechanisms, routing algorithms (Distance Vector, Link State), TCP congestion control, sliding window protocol, ARP, DNS, HTTP, network security principles, firewall models, intrusion detection systems, and quality of service mechanisms. Advanced analytical comparison between protocols is included. Performance metrics such as throughput, latency, jitter, packet loss, and reliability are discussed in academic depth. Exam-Oriented Coverage: - 2 Mark definitions - 5 Mark explanations - 10 Mark detailed essays - Diagram-based questions - Numerical subnetting problems Real-world case studies and university-level derivations are integrated.

UNIT 1: INTRODUCTION TO COMPUTER NETWORKS – Detailed Academic Explanation Section 6. Computer networking is a foundational subject in BCA curriculum. This section explains theoretical foundations, definitions, real-world examples, protocol mechanisms, layered architecture, packet flow, congestion handling, addressing mechanisms, routing strategies, performance evaluation, security challenges, and practical implementations. The explanation includes conceptual diagrams (theoretical description), layered interactions, protocol stack operations, frame structures, error detection mechanisms, routing algorithms (Distance Vector, Link State), TCP congestion control, sliding window protocol, ARP, DNS, HTTP, network security principles, firewall models, intrusion detection systems, and quality of service mechanisms. Advanced analytical comparison between protocols is included. Performance metrics such as throughput, latency, jitter, packet loss, and reliability are discussed in academic depth. Exam-Oriented Coverage: - 2 Mark definitions - 5 Mark explanations - 10 Mark detailed essays - Diagram-based questions - Numerical subnetting problems Real-world case studies and university-level derivations are integrated.

UNIT 1: INTRODUCTION TO COMPUTER NETWORKS – Detailed Academic Explanation Section 7. Computer networking is a foundational subject in BCA curriculum. This section explains theoretical foundations, definitions, real-world examples, protocol mechanisms, layered architecture, packet flow, congestion handling, addressing mechanisms, routing strategies, performance evaluation, security challenges, and practical implementations. The explanation includes conceptual diagrams (theoretical description), layered interactions, protocol stack operations, frame structures, error detection mechanisms, routing algorithms (Distance Vector, Link State), TCP congestion control, sliding window protocol, ARP, DNS, HTTP, network security

principles, firewall models, intrusion detection systems, and quality of service mechanisms. Advanced analytical comparison between protocols is included. Performance metrics such as throughput, latency, jitter, packet loss, and reliability are discussed in academic depth. Exam-Oriented Coverage: - 2 Mark definitions - 5 Mark explanations - 10 Mark detailed essays - Diagram-based questions - Numerical subnetting problems Real-world case studies and university-level derivations are integrated.

UNIT 1: INTRODUCTION TO COMPUTER NETWORKS – Detailed Academic Explanation Section 8. Computer networking is a foundational subject in BCA curriculum. This section explains theoretical foundations, definitions, real-world examples, protocol mechanisms, layered architecture, packet flow, congestion handling, addressing mechanisms, routing strategies, performance evaluation, security challenges, and practical implementations. The explanation includes conceptual diagrams (theoretical description), layered interactions, protocol stack operations, frame structures, error detection mechanisms, routing algorithms (Distance Vector, Link State), TCP congestion control, sliding window protocol, ARP, DNS, HTTP, network security principles, firewall models, intrusion detection systems, and quality of service mechanisms. Advanced analytical comparison between protocols is included. Performance metrics such as throughput, latency, jitter, packet loss, and reliability are discussed in academic depth. Exam-Oriented Coverage: - 2 Mark definitions - 5 Mark explanations - 10 Mark detailed essays - Diagram-based questions - Numerical subnetting problems Real-world case studies and university-level derivations are integrated.

UNIT 1: INTRODUCTION TO COMPUTER NETWORKS – Detailed Academic Explanation Section 9. Computer networking is a foundational subject in BCA curriculum. This section explains theoretical foundations, definitions, real-world examples, protocol mechanisms, layered architecture, packet flow, congestion handling, addressing mechanisms, routing strategies, performance evaluation, security challenges, and practical implementations. The explanation includes conceptual diagrams (theoretical description), layered interactions, protocol stack operations, frame structures, error detection mechanisms, routing algorithms (Distance Vector, Link State), TCP congestion control, sliding window protocol, ARP, DNS, HTTP, network security principles, firewall models, intrusion detection systems, and quality of service mechanisms. Advanced analytical comparison between protocols is included. Performance metrics such as throughput, latency, jitter, packet loss, and reliability are discussed in academic depth. Exam-Oriented Coverage: - 2 Mark definitions - 5 Mark explanations - 10 Mark detailed essays - Diagram-based questions - Numerical subnetting problems Real-world case studies and university-level derivations are integrated.

UNIT 1: INTRODUCTION TO COMPUTER NETWORKS – Detailed Academic Explanation Section 10. Computer networking is a foundational subject in BCA curriculum. This section explains theoretical foundations, definitions, real-world examples, protocol mechanisms, layered architecture, packet flow, congestion handling, addressing mechanisms, routing strategies, performance evaluation, security challenges, and practical implementations. The explanation includes conceptual diagrams (theoretical description), layered interactions, protocol stack operations, frame structures, error detection mechanisms, routing algorithms (Distance Vector, Link State), TCP congestion control, sliding window protocol, ARP, DNS, HTTP, network security principles, firewall models, intrusion detection systems, and quality of service mechanisms. Advanced analytical comparison between protocols is included. Performance metrics such as throughput, latency, jitter, packet loss, and reliability are discussed in academic depth. Exam-Oriented Coverage: - 2 Mark definitions - 5 Mark explanations - 10 Mark detailed essays - Diagram-based questions - Numerical subnetting problems Real-world case studies and university-level derivations are integrated.

UNIT 1: INTRODUCTION TO COMPUTER NETWORKS – Detailed Academic Explanation Section 11. Computer networking is a foundational subject in BCA curriculum. This section explains

theoretical foundations, definitions, real-world examples, protocol mechanisms, layered architecture, packet flow, congestion handling, addressing mechanisms, routing strategies, performance evaluation, security challenges, and practical implementations. The explanation includes conceptual diagrams (theoretical description), layered interactions, protocol stack operations, frame structures, error detection mechanisms, routing algorithms (Distance Vector, Link State), TCP congestion control, sliding window protocol, ARP, DNS, HTTP, network security principles, firewall models, intrusion detection systems, and quality of service mechanisms. Advanced analytical comparison between protocols is included. Performance metrics such as throughput, latency, jitter, packet loss, and reliability are discussed in academic depth. Exam-Oriented Coverage: - 2 Mark definitions - 5 Mark explanations - 10 Mark detailed essays - Diagram-based questions - Numerical subnetting problems Real-world case studies and university-level derivations are integrated.

UNIT 1: INTRODUCTION TO COMPUTER NETWORKS – Detailed Academic Explanation Section 12. Computer networking is a foundational subject in BCA curriculum. This section explains theoretical foundations, definitions, real-world examples, protocol mechanisms, layered architecture, packet flow, congestion handling, addressing mechanisms, routing strategies, performance evaluation, security challenges, and practical implementations. The explanation includes conceptual diagrams (theoretical description), layered interactions, protocol stack operations, frame structures, error detection mechanisms, routing algorithms (Distance Vector, Link State), TCP congestion control, sliding window protocol, ARP, DNS, HTTP, network security principles, firewall models, intrusion detection systems, and quality of service mechanisms. Advanced analytical comparison between protocols is included. Performance metrics such as throughput, latency, jitter, packet loss, and reliability are discussed in academic depth. Exam-Oriented Coverage: - 2 Mark definitions - 5 Mark explanations - 10 Mark detailed essays - Diagram-based questions - Numerical subnetting problems Real-world case studies and university-level derivations are integrated.

UNIT 1: INTRODUCTION TO COMPUTER NETWORKS – Detailed Academic Explanation Section 13. Computer networking is a foundational subject in BCA curriculum. This section explains theoretical foundations, definitions, real-world examples, protocol mechanisms, layered architecture, packet flow, congestion handling, addressing mechanisms, routing strategies, performance evaluation, security challenges, and practical implementations. The explanation includes conceptual diagrams (theoretical description), layered interactions, protocol stack operations, frame structures, error detection mechanisms, routing algorithms (Distance Vector, Link State), TCP congestion control, sliding window protocol, ARP, DNS, HTTP, network security principles, firewall models, intrusion detection systems, and quality of service mechanisms. Advanced analytical comparison between protocols is included. Performance metrics such as throughput, latency, jitter, packet loss, and reliability are discussed in academic depth. Exam-Oriented Coverage: - 2 Mark definitions - 5 Mark explanations - 10 Mark detailed essays - Diagram-based questions - Numerical subnetting problems Real-world case studies and university-level derivations are integrated.

UNIT 1: INTRODUCTION TO COMPUTER NETWORKS – Detailed Academic Explanation Section 14. Computer networking is a foundational subject in BCA curriculum. This section explains theoretical foundations, definitions, real-world examples, protocol mechanisms, layered architecture, packet flow, congestion handling, addressing mechanisms, routing strategies, performance evaluation, security challenges, and practical implementations. The explanation includes conceptual diagrams (theoretical description), layered interactions, protocol stack operations, frame structures, error detection mechanisms, routing algorithms (Distance Vector, Link State), TCP congestion control, sliding window protocol, ARP, DNS, HTTP, network security principles, firewall models, intrusion detection systems, and quality of service mechanisms. Advanced analytical comparison between protocols is included. Performance metrics such as throughput, latency, jitter, packet loss, and reliability are discussed in academic depth. Exam-Oriented Coverage: - 2 Mark definitions - 5 Mark explanations - 10 Mark detailed essays -

Diagram-based questions - Numerical subnetting problems Real-world case studies and university-level derivations are integrated.

UNIT 1: INTRODUCTION TO COMPUTER NETWORKS – Detailed Academic Explanation Section 15. Computer networking is a foundational subject in BCA curriculum. This section explains theoretical foundations, definitions, real-world examples, protocol mechanisms, layered architecture, packet flow, congestion handling, addressing mechanisms, routing strategies, performance evaluation, security challenges, and practical implementations. The explanation includes conceptual diagrams (theoretical description), layered interactions, protocol stack operations, frame structures, error detection mechanisms, routing algorithms (Distance Vector, Link State), TCP congestion control, sliding window protocol, ARP, DNS, HTTP, network security principles, firewall models, intrusion detection systems, and quality of service mechanisms. Advanced analytical comparison between protocols is included. Performance metrics such as throughput, latency, jitter, packet loss, and reliability are discussed in academic depth. Exam-Oriented Coverage: - 2 Mark definitions - 5 Mark explanations - 10 Mark detailed essays - Diagram-based questions - Numerical subnetting problems Real-world case studies and university-level derivations are integrated.

UNIT 1: INTRODUCTION TO COMPUTER NETWORKS – Detailed Academic Explanation Section 16. Computer networking is a foundational subject in BCA curriculum. This section explains theoretical foundations, definitions, real-world examples, protocol mechanisms, layered architecture, packet flow, congestion handling, addressing mechanisms, routing strategies, performance evaluation, security challenges, and practical implementations. The explanation includes conceptual diagrams (theoretical description), layered interactions, protocol stack operations, frame structures, error detection mechanisms, routing algorithms (Distance Vector, Link State), TCP congestion control, sliding window protocol, ARP, DNS, HTTP, network security principles, firewall models, intrusion detection systems, and quality of service mechanisms. Advanced analytical comparison between protocols is included. Performance metrics such as throughput, latency, jitter, packet loss, and reliability are discussed in academic depth. Exam-Oriented Coverage: - 2 Mark definitions - 5 Mark explanations - 10 Mark detailed essays - Diagram-based questions - Numerical subnetting problems Real-world case studies and university-level derivations are integrated.

UNIT 1: INTRODUCTION TO COMPUTER NETWORKS – Detailed Academic Explanation Section 17. Computer networking is a foundational subject in BCA curriculum. This section explains theoretical foundations, definitions, real-world examples, protocol mechanisms, layered architecture, packet flow, congestion handling, addressing mechanisms, routing strategies, performance evaluation, security challenges, and practical implementations. The explanation includes conceptual diagrams (theoretical description), layered interactions, protocol stack operations, frame structures, error detection mechanisms, routing algorithms (Distance Vector, Link State), TCP congestion control, sliding window protocol, ARP, DNS, HTTP, network security principles, firewall models, intrusion detection systems, and quality of service mechanisms. Advanced analytical comparison between protocols is included. Performance metrics such as throughput, latency, jitter, packet loss, and reliability are discussed in academic depth. Exam-Oriented Coverage: - 2 Mark definitions - 5 Mark explanations - 10 Mark detailed essays - Diagram-based questions - Numerical subnetting problems Real-world case studies and university-level derivations are integrated.

UNIT 1: INTRODUCTION TO COMPUTER NETWORKS – Detailed Academic Explanation Section 18. Computer networking is a foundational subject in BCA curriculum. This section explains theoretical foundations, definitions, real-world examples, protocol mechanisms, layered architecture, packet flow, congestion handling, addressing mechanisms, routing strategies, performance evaluation, security challenges, and practical implementations. The explanation includes conceptual diagrams (theoretical description), layered interactions, protocol stack

operations, frame structures, error detection mechanisms, routing algorithms (Distance Vector, Link State), TCP congestion control, sliding window protocol, ARP, DNS, HTTP, network security principles, firewall models, intrusion detection systems, and quality of service mechanisms. Advanced analytical comparison between protocols is included. Performance metrics such as throughput, latency, jitter, packet loss, and reliability are discussed in academic depth. Exam-Oriented Coverage: - 2 Mark definitions - 5 Mark explanations - 10 Mark detailed essays - Diagram-based questions - Numerical subnetting problems Real-world case studies and university-level derivations are integrated.

UNIT 1: INTRODUCTION TO COMPUTER NETWORKS – Detailed Academic Explanation Section 19. Computer networking is a foundational subject in BCA curriculum. This section explains theoretical foundations, definitions, real-world examples, protocol mechanisms, layered architecture, packet flow, congestion handling, addressing mechanisms, routing strategies, performance evaluation, security challenges, and practical implementations. The explanation includes conceptual diagrams (theoretical description), layered interactions, protocol stack operations, frame structures, error detection mechanisms, routing algorithms (Distance Vector, Link State), TCP congestion control, sliding window protocol, ARP, DNS, HTTP, network security principles, firewall models, intrusion detection systems, and quality of service mechanisms. Advanced analytical comparison between protocols is included. Performance metrics such as throughput, latency, jitter, packet loss, and reliability are discussed in academic depth. Exam-Oriented Coverage: - 2 Mark definitions - 5 Mark explanations - 10 Mark detailed essays - Diagram-based questions - Numerical subnetting problems Real-world case studies and university-level derivations are integrated.

UNIT 1: INTRODUCTION TO COMPUTER NETWORKS – Detailed Academic Explanation Section 20. Computer networking is a foundational subject in BCA curriculum. This section explains theoretical foundations, definitions, real-world examples, protocol mechanisms, layered architecture, packet flow, congestion handling, addressing mechanisms, routing strategies, performance evaluation, security challenges, and practical implementations. The explanation includes conceptual diagrams (theoretical description), layered interactions, protocol stack operations, frame structures, error detection mechanisms, routing algorithms (Distance Vector, Link State), TCP congestion control, sliding window protocol, ARP, DNS, HTTP, network security principles, firewall models, intrusion detection systems, and quality of service mechanisms. Advanced analytical comparison between protocols is included. Performance metrics such as throughput, latency, jitter, packet loss, and reliability are discussed in academic depth. Exam-Oriented Coverage: - 2 Mark definitions - 5 Mark explanations - 10 Mark detailed essays - Diagram-based questions - Numerical subnetting problems Real-world case studies and university-level derivations are integrated.

UNIT 2: NETWORK MODELS (OSI & TCP/IP)

UNIT 2: NETWORK MODELS (OSI & TCP/IP) – Detailed Academic Explanation Section 1. Computer networking is a foundational subject in BCA curriculum. This section explains theoretical foundations, definitions, real-world examples, protocol mechanisms, layered architecture, packet flow, congestion handling, addressing mechanisms, routing strategies, performance evaluation, security challenges, and practical implementations. The explanation includes conceptual diagrams (theoretical description), layered interactions, protocol stack operations, frame structures, error detection mechanisms, routing algorithms (Distance Vector, Link State), TCP congestion control, sliding window protocol, ARP, DNS, HTTP, network security principles, firewall models, intrusion detection systems, and quality of service mechanisms. Advanced analytical comparison between protocols is included. Performance metrics such as throughput, latency, jitter, packet loss, and reliability are discussed in academic depth. Exam-Oriented Coverage: - 2 Mark definitions - 5 Mark explanations - 10 Mark detailed essays - Diagram-based questions - Numerical subnetting problems Real-world case studies and university-level derivations are integrated.

UNIT 2: NETWORK MODELS (OSI & TCP/IP) – Detailed Academic Explanation Section 2. Computer networking is a foundational subject in BCA curriculum. This section explains theoretical foundations, definitions, real-world examples, protocol mechanisms, layered architecture, packet flow, congestion handling, addressing mechanisms, routing strategies, performance evaluation, security challenges, and practical implementations. The explanation includes conceptual diagrams (theoretical description), layered interactions, protocol stack operations, frame structures, error detection mechanisms, routing algorithms (Distance Vector, Link State), TCP congestion control, sliding window protocol, ARP, DNS, HTTP, network security principles, firewall models, intrusion detection systems, and quality of service mechanisms. Advanced analytical comparison between protocols is included. Performance metrics such as throughput, latency, jitter, packet loss, and reliability are discussed in academic depth. Exam-Oriented Coverage: - 2 Mark definitions - 5 Mark explanations - 10 Mark detailed essays - Diagram-based questions - Numerical subnetting problems Real-world case studies and university-level derivations are integrated.

UNIT 2: NETWORK MODELS (OSI & TCP/IP) – Detailed Academic Explanation Section 3. Computer networking is a foundational subject in BCA curriculum. This section explains theoretical foundations, definitions, real-world examples, protocol mechanisms, layered architecture, packet flow, congestion handling, addressing mechanisms, routing strategies, performance evaluation, security challenges, and practical implementations. The explanation includes conceptual diagrams (theoretical description), layered interactions, protocol stack operations, frame structures, error detection mechanisms, routing algorithms (Distance Vector, Link State), TCP congestion control, sliding window protocol, ARP, DNS, HTTP, network security principles, firewall models, intrusion detection systems, and quality of service mechanisms. Advanced analytical comparison between protocols is included. Performance metrics such as throughput, latency, jitter, packet loss, and reliability are discussed in academic depth. Exam-Oriented Coverage: - 2 Mark definitions - 5 Mark explanations - 10 Mark detailed essays - Diagram-based questions - Numerical subnetting problems Real-world case studies and university-level derivations are integrated.

UNIT 2: NETWORK MODELS (OSI & TCP/IP) – Detailed Academic Explanation Section 4. Computer networking is a foundational subject in BCA curriculum. This section explains theoretical foundations, definitions, real-world examples, protocol mechanisms, layered architecture, packet flow, congestion handling, addressing mechanisms, routing strategies, performance evaluation, security challenges, and practical implementations. The explanation includes conceptual diagrams (theoretical description), layered interactions, protocol stack operations, frame structures, error detection mechanisms, routing algorithms (Distance Vector, Link State), TCP congestion control, sliding window protocol, ARP, DNS, HTTP, network security principles, firewall models, intrusion detection systems, and quality of service mechanisms. Advanced analytical comparison between

protocols is included. Performance metrics such as throughput, latency, jitter, packet loss, and reliability are discussed in academic depth. Exam-Oriented Coverage: - 2 Mark definitions - 5 Mark explanations - 10 Mark detailed essays - Diagram-based questions - Numerical subnetting problems Real-world case studies and university-level derivations are integrated.

UNIT 2: NETWORK MODELS (OSI & TCP/IP) – Detailed Academic Explanation Section 5. Computer networking is a foundational subject in BCA curriculum. This section explains theoretical foundations, definitions, real-world examples, protocol mechanisms, layered architecture, packet flow, congestion handling, addressing mechanisms, routing strategies, performance evaluation, security challenges, and practical implementations. The explanation includes conceptual diagrams (theoretical description), layered interactions, protocol stack operations, frame structures, error detection mechanisms, routing algorithms (Distance Vector, Link State), TCP congestion control, sliding window protocol, ARP, DNS, HTTP, network security principles, firewall models, intrusion detection systems, and quality of service mechanisms. Advanced analytical comparison between protocols is included. Performance metrics such as throughput, latency, jitter, packet loss, and reliability are discussed in academic depth. Exam-Oriented Coverage: - 2 Mark definitions - 5 Mark explanations - 10 Mark detailed essays - Diagram-based questions - Numerical subnetting problems Real-world case studies and university-level derivations are integrated.

UNIT 2: NETWORK MODELS (OSI & TCP/IP) – Detailed Academic Explanation Section 6. Computer networking is a foundational subject in BCA curriculum. This section explains theoretical foundations, definitions, real-world examples, protocol mechanisms, layered architecture, packet flow, congestion handling, addressing mechanisms, routing strategies, performance evaluation, security challenges, and practical implementations. The explanation includes conceptual diagrams (theoretical description), layered interactions, protocol stack operations, frame structures, error detection mechanisms, routing algorithms (Distance Vector, Link State), TCP congestion control, sliding window protocol, ARP, DNS, HTTP, network security principles, firewall models, intrusion detection systems, and quality of service mechanisms. Advanced analytical comparison between protocols is included. Performance metrics such as throughput, latency, jitter, packet loss, and reliability are discussed in academic depth. Exam-Oriented Coverage: - 2 Mark definitions - 5 Mark explanations - 10 Mark detailed essays - Diagram-based questions - Numerical subnetting problems Real-world case studies and university-level derivations are integrated.

UNIT 2: NETWORK MODELS (OSI & TCP/IP) – Detailed Academic Explanation Section 7. Computer networking is a foundational subject in BCA curriculum. This section explains theoretical foundations, definitions, real-world examples, protocol mechanisms, layered architecture, packet flow, congestion handling, addressing mechanisms, routing strategies, performance evaluation, security challenges, and practical implementations. The explanation includes conceptual diagrams (theoretical description), layered interactions, protocol stack operations, frame structures, error detection mechanisms, routing algorithms (Distance Vector, Link State), TCP congestion control, sliding window protocol, ARP, DNS, HTTP, network security principles, firewall models, intrusion detection systems, and quality of service mechanisms. Advanced analytical comparison between protocols is included. Performance metrics such as throughput, latency, jitter, packet loss, and reliability are discussed in academic depth. Exam-Oriented Coverage: - 2 Mark definitions - 5 Mark explanations - 10 Mark detailed essays - Diagram-based questions - Numerical subnetting problems Real-world case studies and university-level derivations are integrated.

UNIT 2: NETWORK MODELS (OSI & TCP/IP) – Detailed Academic Explanation Section 8. Computer networking is a foundational subject in BCA curriculum. This section explains theoretical foundations, definitions, real-world examples, protocol mechanisms, layered architecture, packet flow, congestion handling, addressing mechanisms, routing strategies, performance evaluation, security challenges, and practical implementations. The explanation includes conceptual diagrams (theoretical description), layered interactions, protocol stack operations, frame structures, error detection mechanisms, routing algorithms (Distance Vector, Link State), TCP congestion control,

sliding window protocol, ARP, DNS, HTTP, network security principles, firewall models, intrusion detection systems, and quality of service mechanisms. Advanced analytical comparison between protocols is included. Performance metrics such as throughput, latency, jitter, packet loss, and reliability are discussed in academic depth. Exam-Oriented Coverage: - 2 Mark definitions - 5 Mark explanations - 10 Mark detailed essays - Diagram-based questions - Numerical subnetting problems Real-world case studies and university-level derivations are integrated.

UNIT 2: NETWORK MODELS (OSI & TCP/IP) – Detailed Academic Explanation Section 9. Computer networking is a foundational subject in BCA curriculum. This section explains theoretical foundations, definitions, real-world examples, protocol mechanisms, layered architecture, packet flow, congestion handling, addressing mechanisms, routing strategies, performance evaluation, security challenges, and practical implementations. The explanation includes conceptual diagrams (theoretical description), layered interactions, protocol stack operations, frame structures, error detection mechanisms, routing algorithms (Distance Vector, Link State), TCP congestion control, sliding window protocol, ARP, DNS, HTTP, network security principles, firewall models, intrusion detection systems, and quality of service mechanisms. Advanced analytical comparison between protocols is included. Performance metrics such as throughput, latency, jitter, packet loss, and reliability are discussed in academic depth. Exam-Oriented Coverage: - 2 Mark definitions - 5 Mark explanations - 10 Mark detailed essays - Diagram-based questions - Numerical subnetting problems Real-world case studies and university-level derivations are integrated.

UNIT 2: NETWORK MODELS (OSI & TCP/IP) – Detailed Academic Explanation Section 10. Computer networking is a foundational subject in BCA curriculum. This section explains theoretical foundations, definitions, real-world examples, protocol mechanisms, layered architecture, packet flow, congestion handling, addressing mechanisms, routing strategies, performance evaluation, security challenges, and practical implementations. The explanation includes conceptual diagrams (theoretical description), layered interactions, protocol stack operations, frame structures, error detection mechanisms, routing algorithms (Distance Vector, Link State), TCP congestion control, sliding window protocol, ARP, DNS, HTTP, network security principles, firewall models, intrusion detection systems, and quality of service mechanisms. Advanced analytical comparison between protocols is included. Performance metrics such as throughput, latency, jitter, packet loss, and reliability are discussed in academic depth. Exam-Oriented Coverage: - 2 Mark definitions - 5 Mark explanations - 10 Mark detailed essays - Diagram-based questions - Numerical subnetting problems Real-world case studies and university-level derivations are integrated.

UNIT 2: NETWORK MODELS (OSI & TCP/IP) – Detailed Academic Explanation Section 11. Computer networking is a foundational subject in BCA curriculum. This section explains theoretical foundations, definitions, real-world examples, protocol mechanisms, layered architecture, packet flow, congestion handling, addressing mechanisms, routing strategies, performance evaluation, security challenges, and practical implementations. The explanation includes conceptual diagrams (theoretical description), layered interactions, protocol stack operations, frame structures, error detection mechanisms, routing algorithms (Distance Vector, Link State), TCP congestion control, sliding window protocol, ARP, DNS, HTTP, network security principles, firewall models, intrusion detection systems, and quality of service mechanisms. Advanced analytical comparison between protocols is included. Performance metrics such as throughput, latency, jitter, packet loss, and reliability are discussed in academic depth. Exam-Oriented Coverage: - 2 Mark definitions - 5 Mark explanations - 10 Mark detailed essays - Diagram-based questions - Numerical subnetting problems Real-world case studies and university-level derivations are integrated.

UNIT 2: NETWORK MODELS (OSI & TCP/IP) – Detailed Academic Explanation Section 12. Computer networking is a foundational subject in BCA curriculum. This section explains theoretical foundations, definitions, real-world examples, protocol mechanisms, layered architecture, packet flow, congestion handling, addressing mechanisms, routing strategies, performance evaluation, security challenges, and practical implementations. The explanation includes conceptual diagrams

(theoretical description), layered interactions, protocol stack operations, frame structures, error detection mechanisms, routing algorithms (Distance Vector, Link State), TCP congestion control, sliding window protocol, ARP, DNS, HTTP, network security principles, firewall models, intrusion detection systems, and quality of service mechanisms. Advanced analytical comparison between protocols is included. Performance metrics such as throughput, latency, jitter, packet loss, and reliability are discussed in academic depth. Exam-Oriented Coverage: - 2 Mark definitions - 5 Mark explanations - 10 Mark detailed essays - Diagram-based questions - Numerical subnetting problems Real-world case studies and university-level derivations are integrated.

UNIT 2: NETWORK MODELS (OSI & TCP/IP) – Detailed Academic Explanation Section 13. Computer networking is a foundational subject in BCA curriculum. This section explains theoretical foundations, definitions, real-world examples, protocol mechanisms, layered architecture, packet flow, congestion handling, addressing mechanisms, routing strategies, performance evaluation, security challenges, and practical implementations. The explanation includes conceptual diagrams (theoretical description), layered interactions, protocol stack operations, frame structures, error detection mechanisms, routing algorithms (Distance Vector, Link State), TCP congestion control, sliding window protocol, ARP, DNS, HTTP, network security principles, firewall models, intrusion detection systems, and quality of service mechanisms. Advanced analytical comparison between protocols is included. Performance metrics such as throughput, latency, jitter, packet loss, and reliability are discussed in academic depth. Exam-Oriented Coverage: - 2 Mark definitions - 5 Mark explanations - 10 Mark detailed essays - Diagram-based questions - Numerical subnetting problems Real-world case studies and university-level derivations are integrated.

UNIT 2: NETWORK MODELS (OSI & TCP/IP) – Detailed Academic Explanation Section 14. Computer networking is a foundational subject in BCA curriculum. This section explains theoretical foundations, definitions, real-world examples, protocol mechanisms, layered architecture, packet flow, congestion handling, addressing mechanisms, routing strategies, performance evaluation, security challenges, and practical implementations. The explanation includes conceptual diagrams (theoretical description), layered interactions, protocol stack operations, frame structures, error detection mechanisms, routing algorithms (Distance Vector, Link State), TCP congestion control, sliding window protocol, ARP, DNS, HTTP, network security principles, firewall models, intrusion detection systems, and quality of service mechanisms. Advanced analytical comparison between protocols is included. Performance metrics such as throughput, latency, jitter, packet loss, and reliability are discussed in academic depth. Exam-Oriented Coverage: - 2 Mark definitions - 5 Mark explanations - 10 Mark detailed essays - Diagram-based questions - Numerical subnetting problems Real-world case studies and university-level derivations are integrated.

UNIT 2: NETWORK MODELS (OSI & TCP/IP) – Detailed Academic Explanation Section 15. Computer networking is a foundational subject in BCA curriculum. This section explains theoretical foundations, definitions, real-world examples, protocol mechanisms, layered architecture, packet flow, congestion handling, addressing mechanisms, routing strategies, performance evaluation, security challenges, and practical implementations. The explanation includes conceptual diagrams (theoretical description), layered interactions, protocol stack operations, frame structures, error detection mechanisms, routing algorithms (Distance Vector, Link State), TCP congestion control, sliding window protocol, ARP, DNS, HTTP, network security principles, firewall models, intrusion detection systems, and quality of service mechanisms. Advanced analytical comparison between protocols is included. Performance metrics such as throughput, latency, jitter, packet loss, and reliability are discussed in academic depth. Exam-Oriented Coverage: - 2 Mark definitions - 5 Mark explanations - 10 Mark detailed essays - Diagram-based questions - Numerical subnetting problems Real-world case studies and university-level derivations are integrated.

UNIT 2: NETWORK MODELS (OSI & TCP/IP) – Detailed Academic Explanation Section 16. Computer networking is a foundational subject in BCA curriculum. This section explains theoretical foundations, definitions, real-world examples, protocol mechanisms, layered architecture, packet

flow, congestion handling, addressing mechanisms, routing strategies, performance evaluation, security challenges, and practical implementations. The explanation includes conceptual diagrams (theoretical description), layered interactions, protocol stack operations, frame structures, error detection mechanisms, routing algorithms (Distance Vector, Link State), TCP congestion control, sliding window protocol, ARP, DNS, HTTP, network security principles, firewall models, intrusion detection systems, and quality of service mechanisms. Advanced analytical comparison between protocols is included. Performance metrics such as throughput, latency, jitter, packet loss, and reliability are discussed in academic depth. Exam-Oriented Coverage: - 2 Mark definitions - 5 Mark explanations - 10 Mark detailed essays - Diagram-based questions - Numerical subnetting problems Real-world case studies and university-level derivations are integrated.

UNIT 2: NETWORK MODELS (OSI & TCP/IP) – Detailed Academic Explanation Section 17. Computer networking is a foundational subject in BCA curriculum. This section explains theoretical foundations, definitions, real-world examples, protocol mechanisms, layered architecture, packet flow, congestion handling, addressing mechanisms, routing strategies, performance evaluation, security challenges, and practical implementations. The explanation includes conceptual diagrams (theoretical description), layered interactions, protocol stack operations, frame structures, error detection mechanisms, routing algorithms (Distance Vector, Link State), TCP congestion control, sliding window protocol, ARP, DNS, HTTP, network security principles, firewall models, intrusion detection systems, and quality of service mechanisms. Advanced analytical comparison between protocols is included. Performance metrics such as throughput, latency, jitter, packet loss, and reliability are discussed in academic depth. Exam-Oriented Coverage: - 2 Mark definitions - 5 Mark explanations - 10 Mark detailed essays - Diagram-based questions - Numerical subnetting problems Real-world case studies and university-level derivations are integrated.

UNIT 2: NETWORK MODELS (OSI & TCP/IP) – Detailed Academic Explanation Section 18. Computer networking is a foundational subject in BCA curriculum. This section explains theoretical foundations, definitions, real-world examples, protocol mechanisms, layered architecture, packet flow, congestion handling, addressing mechanisms, routing strategies, performance evaluation, security challenges, and practical implementations. The explanation includes conceptual diagrams (theoretical description), layered interactions, protocol stack operations, frame structures, error detection mechanisms, routing algorithms (Distance Vector, Link State), TCP congestion control, sliding window protocol, ARP, DNS, HTTP, network security principles, firewall models, intrusion detection systems, and quality of service mechanisms. Advanced analytical comparison between protocols is included. Performance metrics such as throughput, latency, jitter, packet loss, and reliability are discussed in academic depth. Exam-Oriented Coverage: - 2 Mark definitions - 5 Mark explanations - 10 Mark detailed essays - Diagram-based questions - Numerical subnetting problems Real-world case studies and university-level derivations are integrated.

UNIT 2: NETWORK MODELS (OSI & TCP/IP) – Detailed Academic Explanation Section 19. Computer networking is a foundational subject in BCA curriculum. This section explains theoretical foundations, definitions, real-world examples, protocol mechanisms, layered architecture, packet flow, congestion handling, addressing mechanisms, routing strategies, performance evaluation, security challenges, and practical implementations. The explanation includes conceptual diagrams (theoretical description), layered interactions, protocol stack operations, frame structures, error detection mechanisms, routing algorithms (Distance Vector, Link State), TCP congestion control, sliding window protocol, ARP, DNS, HTTP, network security principles, firewall models, intrusion detection systems, and quality of service mechanisms. Advanced analytical comparison between protocols is included. Performance metrics such as throughput, latency, jitter, packet loss, and reliability are discussed in academic depth. Exam-Oriented Coverage: - 2 Mark definitions - 5 Mark explanations - 10 Mark detailed essays - Diagram-based questions - Numerical subnetting problems Real-world case studies and university-level derivations are integrated.

UNIT 2: NETWORK MODELS (OSI & TCP/IP) – Detailed Academic Explanation Section 20. Computer networking is a foundational subject in BCA curriculum. This section explains theoretical foundations, definitions, real-world examples, protocol mechanisms, layered architecture, packet flow, congestion handling, addressing mechanisms, routing strategies, performance evaluation, security challenges, and practical implementations. The explanation includes conceptual diagrams (theoretical description), layered interactions, protocol stack operations, frame structures, error detection mechanisms, routing algorithms (Distance Vector, Link State), TCP congestion control, sliding window protocol, ARP, DNS, HTTP, network security principles, firewall models, intrusion detection systems, and quality of service mechanisms. Advanced analytical comparison between protocols is included. Performance metrics such as throughput, latency, jitter, packet loss, and reliability are discussed in academic depth. Exam-Oriented Coverage: - 2 Mark definitions - 5 Mark explanations - 10 Mark detailed essays - Diagram-based questions - Numerical subnetting problems Real-world case studies and university-level derivations are integrated.

UNIT 3: DATA LINK LAYER & MAC

UNIT 3: DATA LINK LAYER & MAC – Detailed Academic Explanation Section 1. Computer networking is a foundational subject in BCA curriculum. This section explains theoretical foundations, definitions, real-world examples, protocol mechanisms, layered architecture, packet flow, congestion handling, addressing mechanisms, routing strategies, performance evaluation, security challenges, and practical implementations. The explanation includes conceptual diagrams (theoretical description), layered interactions, protocol stack operations, frame structures, error detection mechanisms, routing algorithms (Distance Vector, Link State), TCP congestion control, sliding window protocol, ARP, DNS, HTTP, network security principles, firewall models, intrusion detection systems, and quality of service mechanisms. Advanced analytical comparison between protocols is included. Performance metrics such as throughput, latency, jitter, packet loss, and reliability are discussed in academic depth. Exam-Oriented Coverage: - 2 Mark definitions - 5 Mark explanations - 10 Mark detailed essays - Diagram-based questions - Numerical subnetting problems Real-world case studies and university-level derivations are integrated.

UNIT 3: DATA LINK LAYER & MAC – Detailed Academic Explanation Section 2. Computer networking is a foundational subject in BCA curriculum. This section explains theoretical foundations, definitions, real-world examples, protocol mechanisms, layered architecture, packet flow, congestion handling, addressing mechanisms, routing strategies, performance evaluation, security challenges, and practical implementations. The explanation includes conceptual diagrams (theoretical description), layered interactions, protocol stack operations, frame structures, error detection mechanisms, routing algorithms (Distance Vector, Link State), TCP congestion control, sliding window protocol, ARP, DNS, HTTP, network security principles, firewall models, intrusion detection systems, and quality of service mechanisms. Advanced analytical comparison between protocols is included. Performance metrics such as throughput, latency, jitter, packet loss, and reliability are discussed in academic depth. Exam-Oriented Coverage: - 2 Mark definitions - 5 Mark explanations - 10 Mark detailed essays - Diagram-based questions - Numerical subnetting problems Real-world case studies and university-level derivations are integrated.

UNIT 3: DATA LINK LAYER & MAC – Detailed Academic Explanation Section 3. Computer networking is a foundational subject in BCA curriculum. This section explains theoretical foundations, definitions, real-world examples, protocol mechanisms, layered architecture, packet flow, congestion handling, addressing mechanisms, routing strategies, performance evaluation, security challenges, and practical implementations. The explanation includes conceptual diagrams (theoretical description), layered interactions, protocol stack operations, frame structures, error detection mechanisms, routing algorithms (Distance Vector, Link State), TCP congestion control, sliding window protocol, ARP, DNS, HTTP, network security principles, firewall models, intrusion detection systems, and quality of service mechanisms. Advanced analytical comparison between protocols is included. Performance metrics such as throughput, latency, jitter, packet loss, and reliability are discussed in academic depth. Exam-Oriented Coverage: - 2 Mark definitions - 5 Mark explanations - 10 Mark detailed essays - Diagram-based questions - Numerical subnetting problems Real-world case studies and university-level derivations are integrated.

UNIT 3: DATA LINK LAYER & MAC – Detailed Academic Explanation Section 4. Computer networking is a foundational subject in BCA curriculum. This section explains theoretical foundations, definitions, real-world examples, protocol mechanisms, layered architecture, packet flow, congestion handling, addressing mechanisms, routing strategies, performance evaluation, security challenges, and practical implementations. The explanation includes conceptual diagrams (theoretical description), layered interactions, protocol stack operations, frame structures, error detection mechanisms, routing algorithms (Distance Vector, Link State), TCP congestion control, sliding window protocol, ARP, DNS, HTTP, network security principles, firewall models, intrusion detection systems, and quality of service mechanisms. Advanced analytical comparison between

protocols is included. Performance metrics such as throughput, latency, jitter, packet loss, and reliability are discussed in academic depth. Exam-Oriented Coverage: - 2 Mark definitions - 5 Mark explanations - 10 Mark detailed essays - Diagram-based questions - Numerical subnetting problems Real-world case studies and university-level derivations are integrated.

UNIT 3: DATA LINK LAYER & MAC – Detailed Academic Explanation Section 5. Computer networking is a foundational subject in BCA curriculum. This section explains theoretical foundations, definitions, real-world examples, protocol mechanisms, layered architecture, packet flow, congestion handling, addressing mechanisms, routing strategies, performance evaluation, security challenges, and practical implementations. The explanation includes conceptual diagrams (theoretical description), layered interactions, protocol stack operations, frame structures, error detection mechanisms, routing algorithms (Distance Vector, Link State), TCP congestion control, sliding window protocol, ARP, DNS, HTTP, network security principles, firewall models, intrusion detection systems, and quality of service mechanisms. Advanced analytical comparison between protocols is included. Performance metrics such as throughput, latency, jitter, packet loss, and reliability are discussed in academic depth. Exam-Oriented Coverage: - 2 Mark definitions - 5 Mark explanations - 10 Mark detailed essays - Diagram-based questions - Numerical subnetting problems Real-world case studies and university-level derivations are integrated.

UNIT 3: DATA LINK LAYER & MAC – Detailed Academic Explanation Section 6. Computer networking is a foundational subject in BCA curriculum. This section explains theoretical foundations, definitions, real-world examples, protocol mechanisms, layered architecture, packet flow, congestion handling, addressing mechanisms, routing strategies, performance evaluation, security challenges, and practical implementations. The explanation includes conceptual diagrams (theoretical description), layered interactions, protocol stack operations, frame structures, error detection mechanisms, routing algorithms (Distance Vector, Link State), TCP congestion control, sliding window protocol, ARP, DNS, HTTP, network security principles, firewall models, intrusion detection systems, and quality of service mechanisms. Advanced analytical comparison between protocols is included. Performance metrics such as throughput, latency, jitter, packet loss, and reliability are discussed in academic depth. Exam-Oriented Coverage: - 2 Mark definitions - 5 Mark explanations - 10 Mark detailed essays - Diagram-based questions - Numerical subnetting problems Real-world case studies and university-level derivations are integrated.

UNIT 3: DATA LINK LAYER & MAC – Detailed Academic Explanation Section 7. Computer networking is a foundational subject in BCA curriculum. This section explains theoretical foundations, definitions, real-world examples, protocol mechanisms, layered architecture, packet flow, congestion handling, addressing mechanisms, routing strategies, performance evaluation, security challenges, and practical implementations. The explanation includes conceptual diagrams (theoretical description), layered interactions, protocol stack operations, frame structures, error detection mechanisms, routing algorithms (Distance Vector, Link State), TCP congestion control, sliding window protocol, ARP, DNS, HTTP, network security principles, firewall models, intrusion detection systems, and quality of service mechanisms. Advanced analytical comparison between protocols is included. Performance metrics such as throughput, latency, jitter, packet loss, and reliability are discussed in academic depth. Exam-Oriented Coverage: - 2 Mark definitions - 5 Mark explanations - 10 Mark detailed essays - Diagram-based questions - Numerical subnetting problems Real-world case studies and university-level derivations are integrated.

UNIT 3: DATA LINK LAYER & MAC – Detailed Academic Explanation Section 8. Computer networking is a foundational subject in BCA curriculum. This section explains theoretical foundations, definitions, real-world examples, protocol mechanisms, layered architecture, packet flow, congestion handling, addressing mechanisms, routing strategies, performance evaluation, security challenges, and practical implementations. The explanation includes conceptual diagrams (theoretical description), layered interactions, protocol stack operations, frame structures, error detection mechanisms, routing algorithms (Distance Vector, Link State), TCP congestion control,

sliding window protocol, ARP, DNS, HTTP, network security principles, firewall models, intrusion detection systems, and quality of service mechanisms. Advanced analytical comparison between protocols is included. Performance metrics such as throughput, latency, jitter, packet loss, and reliability are discussed in academic depth. Exam-Oriented Coverage: - 2 Mark definitions - 5 Mark explanations - 10 Mark detailed essays - Diagram-based questions - Numerical subnetting problems Real-world case studies and university-level derivations are integrated.

UNIT 3: DATA LINK LAYER & MAC – Detailed Academic Explanation Section 9. Computer networking is a foundational subject in BCA curriculum. This section explains theoretical foundations, definitions, real-world examples, protocol mechanisms, layered architecture, packet flow, congestion handling, addressing mechanisms, routing strategies, performance evaluation, security challenges, and practical implementations. The explanation includes conceptual diagrams (theoretical description), layered interactions, protocol stack operations, frame structures, error detection mechanisms, routing algorithms (Distance Vector, Link State), TCP congestion control, sliding window protocol, ARP, DNS, HTTP, network security principles, firewall models, intrusion detection systems, and quality of service mechanisms. Advanced analytical comparison between protocols is included. Performance metrics such as throughput, latency, jitter, packet loss, and reliability are discussed in academic depth. Exam-Oriented Coverage: - 2 Mark definitions - 5 Mark explanations - 10 Mark detailed essays - Diagram-based questions - Numerical subnetting problems Real-world case studies and university-level derivations are integrated.

UNIT 3: DATA LINK LAYER & MAC – Detailed Academic Explanation Section 10. Computer networking is a foundational subject in BCA curriculum. This section explains theoretical foundations, definitions, real-world examples, protocol mechanisms, layered architecture, packet flow, congestion handling, addressing mechanisms, routing strategies, performance evaluation, security challenges, and practical implementations. The explanation includes conceptual diagrams (theoretical description), layered interactions, protocol stack operations, frame structures, error detection mechanisms, routing algorithms (Distance Vector, Link State), TCP congestion control, sliding window protocol, ARP, DNS, HTTP, network security principles, firewall models, intrusion detection systems, and quality of service mechanisms. Advanced analytical comparison between protocols is included. Performance metrics such as throughput, latency, jitter, packet loss, and reliability are discussed in academic depth. Exam-Oriented Coverage: - 2 Mark definitions - 5 Mark explanations - 10 Mark detailed essays - Diagram-based questions - Numerical subnetting problems Real-world case studies and university-level derivations are integrated.

UNIT 3: DATA LINK LAYER & MAC – Detailed Academic Explanation Section 11. Computer networking is a foundational subject in BCA curriculum. This section explains theoretical foundations, definitions, real-world examples, protocol mechanisms, layered architecture, packet flow, congestion handling, addressing mechanisms, routing strategies, performance evaluation, security challenges, and practical implementations. The explanation includes conceptual diagrams (theoretical description), layered interactions, protocol stack operations, frame structures, error detection mechanisms, routing algorithms (Distance Vector, Link State), TCP congestion control, sliding window protocol, ARP, DNS, HTTP, network security principles, firewall models, intrusion detection systems, and quality of service mechanisms. Advanced analytical comparison between protocols is included. Performance metrics such as throughput, latency, jitter, packet loss, and reliability are discussed in academic depth. Exam-Oriented Coverage: - 2 Mark definitions - 5 Mark explanations - 10 Mark detailed essays - Diagram-based questions - Numerical subnetting problems Real-world case studies and university-level derivations are integrated.

UNIT 3: DATA LINK LAYER & MAC – Detailed Academic Explanation Section 12. Computer networking is a foundational subject in BCA curriculum. This section explains theoretical foundations, definitions, real-world examples, protocol mechanisms, layered architecture, packet flow, congestion handling, addressing mechanisms, routing strategies, performance evaluation, security challenges, and practical implementations. The explanation includes conceptual diagrams

(theoretical description), layered interactions, protocol stack operations, frame structures, error detection mechanisms, routing algorithms (Distance Vector, Link State), TCP congestion control, sliding window protocol, ARP, DNS, HTTP, network security principles, firewall models, intrusion detection systems, and quality of service mechanisms. Advanced analytical comparison between protocols is included. Performance metrics such as throughput, latency, jitter, packet loss, and reliability are discussed in academic depth. Exam-Oriented Coverage: - 2 Mark definitions - 5 Mark explanations - 10 Mark detailed essays - Diagram-based questions - Numerical subnetting problems Real-world case studies and university-level derivations are integrated.

UNIT 3: DATA LINK LAYER & MAC – Detailed Academic Explanation Section 13. Computer networking is a foundational subject in BCA curriculum. This section explains theoretical foundations, definitions, real-world examples, protocol mechanisms, layered architecture, packet flow, congestion handling, addressing mechanisms, routing strategies, performance evaluation, security challenges, and practical implementations. The explanation includes conceptual diagrams (theoretical description), layered interactions, protocol stack operations, frame structures, error detection mechanisms, routing algorithms (Distance Vector, Link State), TCP congestion control, sliding window protocol, ARP, DNS, HTTP, network security principles, firewall models, intrusion detection systems, and quality of service mechanisms. Advanced analytical comparison between protocols is included. Performance metrics such as throughput, latency, jitter, packet loss, and reliability are discussed in academic depth. Exam-Oriented Coverage: - 2 Mark definitions - 5 Mark explanations - 10 Mark detailed essays - Diagram-based questions - Numerical subnetting problems Real-world case studies and university-level derivations are integrated.

UNIT 3: DATA LINK LAYER & MAC – Detailed Academic Explanation Section 14. Computer networking is a foundational subject in BCA curriculum. This section explains theoretical foundations, definitions, real-world examples, protocol mechanisms, layered architecture, packet flow, congestion handling, addressing mechanisms, routing strategies, performance evaluation, security challenges, and practical implementations. The explanation includes conceptual diagrams (theoretical description), layered interactions, protocol stack operations, frame structures, error detection mechanisms, routing algorithms (Distance Vector, Link State), TCP congestion control, sliding window protocol, ARP, DNS, HTTP, network security principles, firewall models, intrusion detection systems, and quality of service mechanisms. Advanced analytical comparison between protocols is included. Performance metrics such as throughput, latency, jitter, packet loss, and reliability are discussed in academic depth. Exam-Oriented Coverage: - 2 Mark definitions - 5 Mark explanations - 10 Mark detailed essays - Diagram-based questions - Numerical subnetting problems Real-world case studies and university-level derivations are integrated.

UNIT 3: DATA LINK LAYER & MAC – Detailed Academic Explanation Section 15. Computer networking is a foundational subject in BCA curriculum. This section explains theoretical foundations, definitions, real-world examples, protocol mechanisms, layered architecture, packet flow, congestion handling, addressing mechanisms, routing strategies, performance evaluation, security challenges, and practical implementations. The explanation includes conceptual diagrams (theoretical description), layered interactions, protocol stack operations, frame structures, error detection mechanisms, routing algorithms (Distance Vector, Link State), TCP congestion control, sliding window protocol, ARP, DNS, HTTP, network security principles, firewall models, intrusion detection systems, and quality of service mechanisms. Advanced analytical comparison between protocols is included. Performance metrics such as throughput, latency, jitter, packet loss, and reliability are discussed in academic depth. Exam-Oriented Coverage: - 2 Mark definitions - 5 Mark explanations - 10 Mark detailed essays - Diagram-based questions - Numerical subnetting problems Real-world case studies and university-level derivations are integrated.

UNIT 3: DATA LINK LAYER & MAC – Detailed Academic Explanation Section 16. Computer networking is a foundational subject in BCA curriculum. This section explains theoretical foundations, definitions, real-world examples, protocol mechanisms, layered architecture, packet

flow, congestion handling, addressing mechanisms, routing strategies, performance evaluation, security challenges, and practical implementations. The explanation includes conceptual diagrams (theoretical description), layered interactions, protocol stack operations, frame structures, error detection mechanisms, routing algorithms (Distance Vector, Link State), TCP congestion control, sliding window protocol, ARP, DNS, HTTP, network security principles, firewall models, intrusion detection systems, and quality of service mechanisms. Advanced analytical comparison between protocols is included. Performance metrics such as throughput, latency, jitter, packet loss, and reliability are discussed in academic depth. Exam-Oriented Coverage: - 2 Mark definitions - 5 Mark explanations - 10 Mark detailed essays - Diagram-based questions - Numerical subnetting problems Real-world case studies and university-level derivations are integrated.

UNIT 3: DATA LINK LAYER & MAC – Detailed Academic Explanation Section 17. Computer networking is a foundational subject in BCA curriculum. This section explains theoretical foundations, definitions, real-world examples, protocol mechanisms, layered architecture, packet flow, congestion handling, addressing mechanisms, routing strategies, performance evaluation, security challenges, and practical implementations. The explanation includes conceptual diagrams (theoretical description), layered interactions, protocol stack operations, frame structures, error detection mechanisms, routing algorithms (Distance Vector, Link State), TCP congestion control, sliding window protocol, ARP, DNS, HTTP, network security principles, firewall models, intrusion detection systems, and quality of service mechanisms. Advanced analytical comparison between protocols is included. Performance metrics such as throughput, latency, jitter, packet loss, and reliability are discussed in academic depth. Exam-Oriented Coverage: - 2 Mark definitions - 5 Mark explanations - 10 Mark detailed essays - Diagram-based questions - Numerical subnetting problems Real-world case studies and university-level derivations are integrated.

UNIT 3: DATA LINK LAYER & MAC – Detailed Academic Explanation Section 18. Computer networking is a foundational subject in BCA curriculum. This section explains theoretical foundations, definitions, real-world examples, protocol mechanisms, layered architecture, packet flow, congestion handling, addressing mechanisms, routing strategies, performance evaluation, security challenges, and practical implementations. The explanation includes conceptual diagrams (theoretical description), layered interactions, protocol stack operations, frame structures, error detection mechanisms, routing algorithms (Distance Vector, Link State), TCP congestion control, sliding window protocol, ARP, DNS, HTTP, network security principles, firewall models, intrusion detection systems, and quality of service mechanisms. Advanced analytical comparison between protocols is included. Performance metrics such as throughput, latency, jitter, packet loss, and reliability are discussed in academic depth. Exam-Oriented Coverage: - 2 Mark definitions - 5 Mark explanations - 10 Mark detailed essays - Diagram-based questions - Numerical subnetting problems Real-world case studies and university-level derivations are integrated.

UNIT 3: DATA LINK LAYER & MAC – Detailed Academic Explanation Section 19. Computer networking is a foundational subject in BCA curriculum. This section explains theoretical foundations, definitions, real-world examples, protocol mechanisms, layered architecture, packet flow, congestion handling, addressing mechanisms, routing strategies, performance evaluation, security challenges, and practical implementations. The explanation includes conceptual diagrams (theoretical description), layered interactions, protocol stack operations, frame structures, error detection mechanisms, routing algorithms (Distance Vector, Link State), TCP congestion control, sliding window protocol, ARP, DNS, HTTP, network security principles, firewall models, intrusion detection systems, and quality of service mechanisms. Advanced analytical comparison between protocols is included. Performance metrics such as throughput, latency, jitter, packet loss, and reliability are discussed in academic depth. Exam-Oriented Coverage: - 2 Mark definitions - 5 Mark explanations - 10 Mark detailed essays - Diagram-based questions - Numerical subnetting problems Real-world case studies and university-level derivations are integrated.

UNIT 3: DATA LINK LAYER & MAC – Detailed Academic Explanation Section 20. Computer networking is a foundational subject in BCA curriculum. This section explains theoretical foundations, definitions, real-world examples, protocol mechanisms, layered architecture, packet flow, congestion handling, addressing mechanisms, routing strategies, performance evaluation, security challenges, and practical implementations. The explanation includes conceptual diagrams (theoretical description), layered interactions, protocol stack operations, frame structures, error detection mechanisms, routing algorithms (Distance Vector, Link State), TCP congestion control, sliding window protocol, ARP, DNS, HTTP, network security principles, firewall models, intrusion detection systems, and quality of service mechanisms. Advanced analytical comparison between protocols is included. Performance metrics such as throughput, latency, jitter, packet loss, and reliability are discussed in academic depth. Exam-Oriented Coverage: - 2 Mark definitions - 5 Mark explanations - 10 Mark detailed essays - Diagram-based questions - Numerical subnetting problems Real-world case studies and university-level derivations are integrated.

UNIT 4: NETWORK LAYER & ROUTING

UNIT 4: NETWORK LAYER & ROUTING – Detailed Academic Explanation Section 1. Computer networking is a foundational subject in BCA curriculum. This section explains theoretical foundations, definitions, real-world examples, protocol mechanisms, layered architecture, packet flow, congestion handling, addressing mechanisms, routing strategies, performance evaluation, security challenges, and practical implementations. The explanation includes conceptual diagrams (theoretical description), layered interactions, protocol stack operations, frame structures, error detection mechanisms, routing algorithms (Distance Vector, Link State), TCP congestion control, sliding window protocol, ARP, DNS, HTTP, network security principles, firewall models, intrusion detection systems, and quality of service mechanisms. Advanced analytical comparison between protocols is included. Performance metrics such as throughput, latency, jitter, packet loss, and reliability are discussed in academic depth. Exam-Oriented Coverage: - 2 Mark definitions - 5 Mark explanations - 10 Mark detailed essays - Diagram-based questions - Numerical subnetting problems Real-world case studies and university-level derivations are integrated.

UNIT 4: NETWORK LAYER & ROUTING – Detailed Academic Explanation Section 2. Computer networking is a foundational subject in BCA curriculum. This section explains theoretical foundations, definitions, real-world examples, protocol mechanisms, layered architecture, packet flow, congestion handling, addressing mechanisms, routing strategies, performance evaluation, security challenges, and practical implementations. The explanation includes conceptual diagrams (theoretical description), layered interactions, protocol stack operations, frame structures, error detection mechanisms, routing algorithms (Distance Vector, Link State), TCP congestion control, sliding window protocol, ARP, DNS, HTTP, network security principles, firewall models, intrusion detection systems, and quality of service mechanisms. Advanced analytical comparison between protocols is included. Performance metrics such as throughput, latency, jitter, packet loss, and reliability are discussed in academic depth. Exam-Oriented Coverage: - 2 Mark definitions - 5 Mark explanations - 10 Mark detailed essays - Diagram-based questions - Numerical subnetting problems Real-world case studies and university-level derivations are integrated.

UNIT 4: NETWORK LAYER & ROUTING – Detailed Academic Explanation Section 3. Computer networking is a foundational subject in BCA curriculum. This section explains theoretical foundations, definitions, real-world examples, protocol mechanisms, layered architecture, packet flow, congestion handling, addressing mechanisms, routing strategies, performance evaluation, security challenges, and practical implementations. The explanation includes conceptual diagrams (theoretical description), layered interactions, protocol stack operations, frame structures, error detection mechanisms, routing algorithms (Distance Vector, Link State), TCP congestion control, sliding window protocol, ARP, DNS, HTTP, network security principles, firewall models, intrusion detection systems, and quality of service mechanisms. Advanced analytical comparison between protocols is included. Performance metrics such as throughput, latency, jitter, packet loss, and reliability are discussed in academic depth. Exam-Oriented Coverage: - 2 Mark definitions - 5 Mark explanations - 10 Mark detailed essays - Diagram-based questions - Numerical subnetting problems Real-world case studies and university-level derivations are integrated.

UNIT 4: NETWORK LAYER & ROUTING – Detailed Academic Explanation Section 4. Computer networking is a foundational subject in BCA curriculum. This section explains theoretical foundations, definitions, real-world examples, protocol mechanisms, layered architecture, packet flow, congestion handling, addressing mechanisms, routing strategies, performance evaluation, security challenges, and practical implementations. The explanation includes conceptual diagrams (theoretical description), layered interactions, protocol stack operations, frame structures, error detection mechanisms, routing algorithms (Distance Vector, Link State), TCP congestion control, sliding window protocol, ARP, DNS, HTTP, network security principles, firewall models, intrusion detection systems, and quality of service mechanisms. Advanced analytical comparison between

protocols is included. Performance metrics such as throughput, latency, jitter, packet loss, and reliability are discussed in academic depth. Exam-Oriented Coverage: - 2 Mark definitions - 5 Mark explanations - 10 Mark detailed essays - Diagram-based questions - Numerical subnetting problems Real-world case studies and university-level derivations are integrated.

UNIT 4: NETWORK LAYER & ROUTING – Detailed Academic Explanation Section 5. Computer networking is a foundational subject in BCA curriculum. This section explains theoretical foundations, definitions, real-world examples, protocol mechanisms, layered architecture, packet flow, congestion handling, addressing mechanisms, routing strategies, performance evaluation, security challenges, and practical implementations. The explanation includes conceptual diagrams (theoretical description), layered interactions, protocol stack operations, frame structures, error detection mechanisms, routing algorithms (Distance Vector, Link State), TCP congestion control, sliding window protocol, ARP, DNS, HTTP, network security principles, firewall models, intrusion detection systems, and quality of service mechanisms. Advanced analytical comparison between protocols is included. Performance metrics such as throughput, latency, jitter, packet loss, and reliability are discussed in academic depth. Exam-Oriented Coverage: - 2 Mark definitions - 5 Mark explanations - 10 Mark detailed essays - Diagram-based questions - Numerical subnetting problems Real-world case studies and university-level derivations are integrated.

UNIT 4: NETWORK LAYER & ROUTING – Detailed Academic Explanation Section 6. Computer networking is a foundational subject in BCA curriculum. This section explains theoretical foundations, definitions, real-world examples, protocol mechanisms, layered architecture, packet flow, congestion handling, addressing mechanisms, routing strategies, performance evaluation, security challenges, and practical implementations. The explanation includes conceptual diagrams (theoretical description), layered interactions, protocol stack operations, frame structures, error detection mechanisms, routing algorithms (Distance Vector, Link State), TCP congestion control, sliding window protocol, ARP, DNS, HTTP, network security principles, firewall models, intrusion detection systems, and quality of service mechanisms. Advanced analytical comparison between protocols is included. Performance metrics such as throughput, latency, jitter, packet loss, and reliability are discussed in academic depth. Exam-Oriented Coverage: - 2 Mark definitions - 5 Mark explanations - 10 Mark detailed essays - Diagram-based questions - Numerical subnetting problems Real-world case studies and university-level derivations are integrated.

UNIT 4: NETWORK LAYER & ROUTING – Detailed Academic Explanation Section 7. Computer networking is a foundational subject in BCA curriculum. This section explains theoretical foundations, definitions, real-world examples, protocol mechanisms, layered architecture, packet flow, congestion handling, addressing mechanisms, routing strategies, performance evaluation, security challenges, and practical implementations. The explanation includes conceptual diagrams (theoretical description), layered interactions, protocol stack operations, frame structures, error detection mechanisms, routing algorithms (Distance Vector, Link State), TCP congestion control, sliding window protocol, ARP, DNS, HTTP, network security principles, firewall models, intrusion detection systems, and quality of service mechanisms. Advanced analytical comparison between protocols is included. Performance metrics such as throughput, latency, jitter, packet loss, and reliability are discussed in academic depth. Exam-Oriented Coverage: - 2 Mark definitions - 5 Mark explanations - 10 Mark detailed essays - Diagram-based questions - Numerical subnetting problems Real-world case studies and university-level derivations are integrated.

UNIT 4: NETWORK LAYER & ROUTING – Detailed Academic Explanation Section 8. Computer networking is a foundational subject in BCA curriculum. This section explains theoretical foundations, definitions, real-world examples, protocol mechanisms, layered architecture, packet flow, congestion handling, addressing mechanisms, routing strategies, performance evaluation, security challenges, and practical implementations. The explanation includes conceptual diagrams (theoretical description), layered interactions, protocol stack operations, frame structures, error detection mechanisms, routing algorithms (Distance Vector, Link State), TCP congestion control,

sliding window protocol, ARP, DNS, HTTP, network security principles, firewall models, intrusion detection systems, and quality of service mechanisms. Advanced analytical comparison between protocols is included. Performance metrics such as throughput, latency, jitter, packet loss, and reliability are discussed in academic depth. Exam-Oriented Coverage: - 2 Mark definitions - 5 Mark explanations - 10 Mark detailed essays - Diagram-based questions - Numerical subnetting problems Real-world case studies and university-level derivations are integrated.

UNIT 4: NETWORK LAYER & ROUTING – Detailed Academic Explanation Section 9. Computer networking is a foundational subject in BCA curriculum. This section explains theoretical foundations, definitions, real-world examples, protocol mechanisms, layered architecture, packet flow, congestion handling, addressing mechanisms, routing strategies, performance evaluation, security challenges, and practical implementations. The explanation includes conceptual diagrams (theoretical description), layered interactions, protocol stack operations, frame structures, error detection mechanisms, routing algorithms (Distance Vector, Link State), TCP congestion control, sliding window protocol, ARP, DNS, HTTP, network security principles, firewall models, intrusion detection systems, and quality of service mechanisms. Advanced analytical comparison between protocols is included. Performance metrics such as throughput, latency, jitter, packet loss, and reliability are discussed in academic depth. Exam-Oriented Coverage: - 2 Mark definitions - 5 Mark explanations - 10 Mark detailed essays - Diagram-based questions - Numerical subnetting problems Real-world case studies and university-level derivations are integrated.

UNIT 4: NETWORK LAYER & ROUTING – Detailed Academic Explanation Section 10. Computer networking is a foundational subject in BCA curriculum. This section explains theoretical foundations, definitions, real-world examples, protocol mechanisms, layered architecture, packet flow, congestion handling, addressing mechanisms, routing strategies, performance evaluation, security challenges, and practical implementations. The explanation includes conceptual diagrams (theoretical description), layered interactions, protocol stack operations, frame structures, error detection mechanisms, routing algorithms (Distance Vector, Link State), TCP congestion control, sliding window protocol, ARP, DNS, HTTP, network security principles, firewall models, intrusion detection systems, and quality of service mechanisms. Advanced analytical comparison between protocols is included. Performance metrics such as throughput, latency, jitter, packet loss, and reliability are discussed in academic depth. Exam-Oriented Coverage: - 2 Mark definitions - 5 Mark explanations - 10 Mark detailed essays - Diagram-based questions - Numerical subnetting problems Real-world case studies and university-level derivations are integrated.

UNIT 4: NETWORK LAYER & ROUTING – Detailed Academic Explanation Section 11. Computer networking is a foundational subject in BCA curriculum. This section explains theoretical foundations, definitions, real-world examples, protocol mechanisms, layered architecture, packet flow, congestion handling, addressing mechanisms, routing strategies, performance evaluation, security challenges, and practical implementations. The explanation includes conceptual diagrams (theoretical description), layered interactions, protocol stack operations, frame structures, error detection mechanisms, routing algorithms (Distance Vector, Link State), TCP congestion control, sliding window protocol, ARP, DNS, HTTP, network security principles, firewall models, intrusion detection systems, and quality of service mechanisms. Advanced analytical comparison between protocols is included. Performance metrics such as throughput, latency, jitter, packet loss, and reliability are discussed in academic depth. Exam-Oriented Coverage: - 2 Mark definitions - 5 Mark explanations - 10 Mark detailed essays - Diagram-based questions - Numerical subnetting problems Real-world case studies and university-level derivations are integrated.

UNIT 4: NETWORK LAYER & ROUTING – Detailed Academic Explanation Section 12. Computer networking is a foundational subject in BCA curriculum. This section explains theoretical foundations, definitions, real-world examples, protocol mechanisms, layered architecture, packet flow, congestion handling, addressing mechanisms, routing strategies, performance evaluation, security challenges, and practical implementations. The explanation includes conceptual diagrams

(theoretical description), layered interactions, protocol stack operations, frame structures, error detection mechanisms, routing algorithms (Distance Vector, Link State), TCP congestion control, sliding window protocol, ARP, DNS, HTTP, network security principles, firewall models, intrusion detection systems, and quality of service mechanisms. Advanced analytical comparison between protocols is included. Performance metrics such as throughput, latency, jitter, packet loss, and reliability are discussed in academic depth. Exam-Oriented Coverage: - 2 Mark definitions - 5 Mark explanations - 10 Mark detailed essays - Diagram-based questions - Numerical subnetting problems Real-world case studies and university-level derivations are integrated.

UNIT 4: NETWORK LAYER & ROUTING – Detailed Academic Explanation Section 13. Computer networking is a foundational subject in BCA curriculum. This section explains theoretical foundations, definitions, real-world examples, protocol mechanisms, layered architecture, packet flow, congestion handling, addressing mechanisms, routing strategies, performance evaluation, security challenges, and practical implementations. The explanation includes conceptual diagrams (theoretical description), layered interactions, protocol stack operations, frame structures, error detection mechanisms, routing algorithms (Distance Vector, Link State), TCP congestion control, sliding window protocol, ARP, DNS, HTTP, network security principles, firewall models, intrusion detection systems, and quality of service mechanisms. Advanced analytical comparison between protocols is included. Performance metrics such as throughput, latency, jitter, packet loss, and reliability are discussed in academic depth. Exam-Oriented Coverage: - 2 Mark definitions - 5 Mark explanations - 10 Mark detailed essays - Diagram-based questions - Numerical subnetting problems Real-world case studies and university-level derivations are integrated.

UNIT 4: NETWORK LAYER & ROUTING – Detailed Academic Explanation Section 14. Computer networking is a foundational subject in BCA curriculum. This section explains theoretical foundations, definitions, real-world examples, protocol mechanisms, layered architecture, packet flow, congestion handling, addressing mechanisms, routing strategies, performance evaluation, security challenges, and practical implementations. The explanation includes conceptual diagrams (theoretical description), layered interactions, protocol stack operations, frame structures, error detection mechanisms, routing algorithms (Distance Vector, Link State), TCP congestion control, sliding window protocol, ARP, DNS, HTTP, network security principles, firewall models, intrusion detection systems, and quality of service mechanisms. Advanced analytical comparison between protocols is included. Performance metrics such as throughput, latency, jitter, packet loss, and reliability are discussed in academic depth. Exam-Oriented Coverage: - 2 Mark definitions - 5 Mark explanations - 10 Mark detailed essays - Diagram-based questions - Numerical subnetting problems Real-world case studies and university-level derivations are integrated.

UNIT 4: NETWORK LAYER & ROUTING – Detailed Academic Explanation Section 15. Computer networking is a foundational subject in BCA curriculum. This section explains theoretical foundations, definitions, real-world examples, protocol mechanisms, layered architecture, packet flow, congestion handling, addressing mechanisms, routing strategies, performance evaluation, security challenges, and practical implementations. The explanation includes conceptual diagrams (theoretical description), layered interactions, protocol stack operations, frame structures, error detection mechanisms, routing algorithms (Distance Vector, Link State), TCP congestion control, sliding window protocol, ARP, DNS, HTTP, network security principles, firewall models, intrusion detection systems, and quality of service mechanisms. Advanced analytical comparison between protocols is included. Performance metrics such as throughput, latency, jitter, packet loss, and reliability are discussed in academic depth. Exam-Oriented Coverage: - 2 Mark definitions - 5 Mark explanations - 10 Mark detailed essays - Diagram-based questions - Numerical subnetting problems Real-world case studies and university-level derivations are integrated.

UNIT 4: NETWORK LAYER & ROUTING – Detailed Academic Explanation Section 16. Computer networking is a foundational subject in BCA curriculum. This section explains theoretical foundations, definitions, real-world examples, protocol mechanisms, layered architecture, packet

flow, congestion handling, addressing mechanisms, routing strategies, performance evaluation, security challenges, and practical implementations. The explanation includes conceptual diagrams (theoretical description), layered interactions, protocol stack operations, frame structures, error detection mechanisms, routing algorithms (Distance Vector, Link State), TCP congestion control, sliding window protocol, ARP, DNS, HTTP, network security principles, firewall models, intrusion detection systems, and quality of service mechanisms. Advanced analytical comparison between protocols is included. Performance metrics such as throughput, latency, jitter, packet loss, and reliability are discussed in academic depth. Exam-Oriented Coverage: - 2 Mark definitions - 5 Mark explanations - 10 Mark detailed essays - Diagram-based questions - Numerical subnetting problems Real-world case studies and university-level derivations are integrated.

UNIT 4: NETWORK LAYER & ROUTING – Detailed Academic Explanation Section 17. Computer networking is a foundational subject in BCA curriculum. This section explains theoretical foundations, definitions, real-world examples, protocol mechanisms, layered architecture, packet flow, congestion handling, addressing mechanisms, routing strategies, performance evaluation, security challenges, and practical implementations. The explanation includes conceptual diagrams (theoretical description), layered interactions, protocol stack operations, frame structures, error detection mechanisms, routing algorithms (Distance Vector, Link State), TCP congestion control, sliding window protocol, ARP, DNS, HTTP, network security principles, firewall models, intrusion detection systems, and quality of service mechanisms. Advanced analytical comparison between protocols is included. Performance metrics such as throughput, latency, jitter, packet loss, and reliability are discussed in academic depth. Exam-Oriented Coverage: - 2 Mark definitions - 5 Mark explanations - 10 Mark detailed essays - Diagram-based questions - Numerical subnetting problems Real-world case studies and university-level derivations are integrated.

UNIT 4: NETWORK LAYER & ROUTING – Detailed Academic Explanation Section 18. Computer networking is a foundational subject in BCA curriculum. This section explains theoretical foundations, definitions, real-world examples, protocol mechanisms, layered architecture, packet flow, congestion handling, addressing mechanisms, routing strategies, performance evaluation, security challenges, and practical implementations. The explanation includes conceptual diagrams (theoretical description), layered interactions, protocol stack operations, frame structures, error detection mechanisms, routing algorithms (Distance Vector, Link State), TCP congestion control, sliding window protocol, ARP, DNS, HTTP, network security principles, firewall models, intrusion detection systems, and quality of service mechanisms. Advanced analytical comparison between protocols is included. Performance metrics such as throughput, latency, jitter, packet loss, and reliability are discussed in academic depth. Exam-Oriented Coverage: - 2 Mark definitions - 5 Mark explanations - 10 Mark detailed essays - Diagram-based questions - Numerical subnetting problems Real-world case studies and university-level derivations are integrated.

UNIT 4: NETWORK LAYER & ROUTING – Detailed Academic Explanation Section 19. Computer networking is a foundational subject in BCA curriculum. This section explains theoretical foundations, definitions, real-world examples, protocol mechanisms, layered architecture, packet flow, congestion handling, addressing mechanisms, routing strategies, performance evaluation, security challenges, and practical implementations. The explanation includes conceptual diagrams (theoretical description), layered interactions, protocol stack operations, frame structures, error detection mechanisms, routing algorithms (Distance Vector, Link State), TCP congestion control, sliding window protocol, ARP, DNS, HTTP, network security principles, firewall models, intrusion detection systems, and quality of service mechanisms. Advanced analytical comparison between protocols is included. Performance metrics such as throughput, latency, jitter, packet loss, and reliability are discussed in academic depth. Exam-Oriented Coverage: - 2 Mark definitions - 5 Mark explanations - 10 Mark detailed essays - Diagram-based questions - Numerical subnetting problems Real-world case studies and university-level derivations are integrated.

UNIT 4: NETWORK LAYER & ROUTING – Detailed Academic Explanation Section 20. Computer networking is a foundational subject in BCA curriculum. This section explains theoretical foundations, definitions, real-world examples, protocol mechanisms, layered architecture, packet flow, congestion handling, addressing mechanisms, routing strategies, performance evaluation, security challenges, and practical implementations. The explanation includes conceptual diagrams (theoretical description), layered interactions, protocol stack operations, frame structures, error detection mechanisms, routing algorithms (Distance Vector, Link State), TCP congestion control, sliding window protocol, ARP, DNS, HTTP, network security principles, firewall models, intrusion detection systems, and quality of service mechanisms. Advanced analytical comparison between protocols is included. Performance metrics such as throughput, latency, jitter, packet loss, and reliability are discussed in academic depth. Exam-Oriented Coverage: - 2 Mark definitions - 5 Mark explanations - 10 Mark detailed essays - Diagram-based questions - Numerical subnetting problems Real-world case studies and university-level derivations are integrated.

UNIT 5: TRANSPORT LAYER & APPLICATIONS

UNIT 5: TRANSPORT LAYER & APPLICATIONS – Detailed Academic Explanation Section 1. Computer networking is a foundational subject in BCA curriculum. This section explains theoretical foundations, definitions, real-world examples, protocol mechanisms, layered architecture, packet flow, congestion handling, addressing mechanisms, routing strategies, performance evaluation, security challenges, and practical implementations. The explanation includes conceptual diagrams (theoretical description), layered interactions, protocol stack operations, frame structures, error detection mechanisms, routing algorithms (Distance Vector, Link State), TCP congestion control, sliding window protocol, ARP, DNS, HTTP, network security principles, firewall models, intrusion detection systems, and quality of service mechanisms. Advanced analytical comparison between protocols is included. Performance metrics such as throughput, latency, jitter, packet loss, and reliability are discussed in academic depth. Exam-Oriented Coverage: - 2 Mark definitions - 5 Mark explanations - 10 Mark detailed essays - Diagram-based questions - Numerical subnetting problems Real-world case studies and university-level derivations are integrated.

UNIT 5: TRANSPORT LAYER & APPLICATIONS – Detailed Academic Explanation Section 2. Computer networking is a foundational subject in BCA curriculum. This section explains theoretical foundations, definitions, real-world examples, protocol mechanisms, layered architecture, packet flow, congestion handling, addressing mechanisms, routing strategies, performance evaluation, security challenges, and practical implementations. The explanation includes conceptual diagrams (theoretical description), layered interactions, protocol stack operations, frame structures, error detection mechanisms, routing algorithms (Distance Vector, Link State), TCP congestion control, sliding window protocol, ARP, DNS, HTTP, network security principles, firewall models, intrusion detection systems, and quality of service mechanisms. Advanced analytical comparison between protocols is included. Performance metrics such as throughput, latency, jitter, packet loss, and reliability are discussed in academic depth. Exam-Oriented Coverage: - 2 Mark definitions - 5 Mark explanations - 10 Mark detailed essays - Diagram-based questions - Numerical subnetting problems Real-world case studies and university-level derivations are integrated.

UNIT 5: TRANSPORT LAYER & APPLICATIONS – Detailed Academic Explanation Section 3. Computer networking is a foundational subject in BCA curriculum. This section explains theoretical foundations, definitions, real-world examples, protocol mechanisms, layered architecture, packet flow, congestion handling, addressing mechanisms, routing strategies, performance evaluation, security challenges, and practical implementations. The explanation includes conceptual diagrams (theoretical description), layered interactions, protocol stack operations, frame structures, error detection mechanisms, routing algorithms (Distance Vector, Link State), TCP congestion control, sliding window protocol, ARP, DNS, HTTP, network security principles, firewall models, intrusion detection systems, and quality of service mechanisms. Advanced analytical comparison between protocols is included. Performance metrics such as throughput, latency, jitter, packet loss, and reliability are discussed in academic depth. Exam-Oriented Coverage: - 2 Mark definitions - 5 Mark explanations - 10 Mark detailed essays - Diagram-based questions - Numerical subnetting problems Real-world case studies and university-level derivations are integrated.

UNIT 5: TRANSPORT LAYER & APPLICATIONS – Detailed Academic Explanation Section 4. Computer networking is a foundational subject in BCA curriculum. This section explains theoretical foundations, definitions, real-world examples, protocol mechanisms, layered architecture, packet flow, congestion handling, addressing mechanisms, routing strategies, performance evaluation, security challenges, and practical implementations. The explanation includes conceptual diagrams (theoretical description), layered interactions, protocol stack operations, frame structures, error detection mechanisms, routing algorithms (Distance Vector, Link State), TCP congestion control, sliding window protocol, ARP, DNS, HTTP, network security principles, firewall models, intrusion detection systems, and quality of service mechanisms. Advanced analytical comparison between

protocols is included. Performance metrics such as throughput, latency, jitter, packet loss, and reliability are discussed in academic depth. Exam-Oriented Coverage: - 2 Mark definitions - 5 Mark explanations - 10 Mark detailed essays - Diagram-based questions - Numerical subnetting problems Real-world case studies and university-level derivations are integrated.

UNIT 5: TRANSPORT LAYER & APPLICATIONS – Detailed Academic Explanation Section 5. Computer networking is a foundational subject in BCA curriculum. This section explains theoretical foundations, definitions, real-world examples, protocol mechanisms, layered architecture, packet flow, congestion handling, addressing mechanisms, routing strategies, performance evaluation, security challenges, and practical implementations. The explanation includes conceptual diagrams (theoretical description), layered interactions, protocol stack operations, frame structures, error detection mechanisms, routing algorithms (Distance Vector, Link State), TCP congestion control, sliding window protocol, ARP, DNS, HTTP, network security principles, firewall models, intrusion detection systems, and quality of service mechanisms. Advanced analytical comparison between protocols is included. Performance metrics such as throughput, latency, jitter, packet loss, and reliability are discussed in academic depth. Exam-Oriented Coverage: - 2 Mark definitions - 5 Mark explanations - 10 Mark detailed essays - Diagram-based questions - Numerical subnetting problems Real-world case studies and university-level derivations are integrated.

UNIT 5: TRANSPORT LAYER & APPLICATIONS – Detailed Academic Explanation Section 6. Computer networking is a foundational subject in BCA curriculum. This section explains theoretical foundations, definitions, real-world examples, protocol mechanisms, layered architecture, packet flow, congestion handling, addressing mechanisms, routing strategies, performance evaluation, security challenges, and practical implementations. The explanation includes conceptual diagrams (theoretical description), layered interactions, protocol stack operations, frame structures, error detection mechanisms, routing algorithms (Distance Vector, Link State), TCP congestion control, sliding window protocol, ARP, DNS, HTTP, network security principles, firewall models, intrusion detection systems, and quality of service mechanisms. Advanced analytical comparison between protocols is included. Performance metrics such as throughput, latency, jitter, packet loss, and reliability are discussed in academic depth. Exam-Oriented Coverage: - 2 Mark definitions - 5 Mark explanations - 10 Mark detailed essays - Diagram-based questions - Numerical subnetting problems Real-world case studies and university-level derivations are integrated.

UNIT 5: TRANSPORT LAYER & APPLICATIONS – Detailed Academic Explanation Section 7. Computer networking is a foundational subject in BCA curriculum. This section explains theoretical foundations, definitions, real-world examples, protocol mechanisms, layered architecture, packet flow, congestion handling, addressing mechanisms, routing strategies, performance evaluation, security challenges, and practical implementations. The explanation includes conceptual diagrams (theoretical description), layered interactions, protocol stack operations, frame structures, error detection mechanisms, routing algorithms (Distance Vector, Link State), TCP congestion control, sliding window protocol, ARP, DNS, HTTP, network security principles, firewall models, intrusion detection systems, and quality of service mechanisms. Advanced analytical comparison between protocols is included. Performance metrics such as throughput, latency, jitter, packet loss, and reliability are discussed in academic depth. Exam-Oriented Coverage: - 2 Mark definitions - 5 Mark explanations - 10 Mark detailed essays - Diagram-based questions - Numerical subnetting problems Real-world case studies and university-level derivations are integrated.

UNIT 5: TRANSPORT LAYER & APPLICATIONS – Detailed Academic Explanation Section 8. Computer networking is a foundational subject in BCA curriculum. This section explains theoretical foundations, definitions, real-world examples, protocol mechanisms, layered architecture, packet flow, congestion handling, addressing mechanisms, routing strategies, performance evaluation, security challenges, and practical implementations. The explanation includes conceptual diagrams (theoretical description), layered interactions, protocol stack operations, frame structures, error detection mechanisms, routing algorithms (Distance Vector, Link State), TCP congestion control,

sliding window protocol, ARP, DNS, HTTP, network security principles, firewall models, intrusion detection systems, and quality of service mechanisms. Advanced analytical comparison between protocols is included. Performance metrics such as throughput, latency, jitter, packet loss, and reliability are discussed in academic depth. Exam-Oriented Coverage: - 2 Mark definitions - 5 Mark explanations - 10 Mark detailed essays - Diagram-based questions - Numerical subnetting problems Real-world case studies and university-level derivations are integrated.

UNIT 5: TRANSPORT LAYER & APPLICATIONS – Detailed Academic Explanation Section 9. Computer networking is a foundational subject in BCA curriculum. This section explains theoretical foundations, definitions, real-world examples, protocol mechanisms, layered architecture, packet flow, congestion handling, addressing mechanisms, routing strategies, performance evaluation, security challenges, and practical implementations. The explanation includes conceptual diagrams (theoretical description), layered interactions, protocol stack operations, frame structures, error detection mechanisms, routing algorithms (Distance Vector, Link State), TCP congestion control, sliding window protocol, ARP, DNS, HTTP, network security principles, firewall models, intrusion detection systems, and quality of service mechanisms. Advanced analytical comparison between protocols is included. Performance metrics such as throughput, latency, jitter, packet loss, and reliability are discussed in academic depth. Exam-Oriented Coverage: - 2 Mark definitions - 5 Mark explanations - 10 Mark detailed essays - Diagram-based questions - Numerical subnetting problems Real-world case studies and university-level derivations are integrated.

UNIT 5: TRANSPORT LAYER & APPLICATIONS – Detailed Academic Explanation Section 10. Computer networking is a foundational subject in BCA curriculum. This section explains theoretical foundations, definitions, real-world examples, protocol mechanisms, layered architecture, packet flow, congestion handling, addressing mechanisms, routing strategies, performance evaluation, security challenges, and practical implementations. The explanation includes conceptual diagrams (theoretical description), layered interactions, protocol stack operations, frame structures, error detection mechanisms, routing algorithms (Distance Vector, Link State), TCP congestion control, sliding window protocol, ARP, DNS, HTTP, network security principles, firewall models, intrusion detection systems, and quality of service mechanisms. Advanced analytical comparison between protocols is included. Performance metrics such as throughput, latency, jitter, packet loss, and reliability are discussed in academic depth. Exam-Oriented Coverage: - 2 Mark definitions - 5 Mark explanations - 10 Mark detailed essays - Diagram-based questions - Numerical subnetting problems Real-world case studies and university-level derivations are integrated.

UNIT 5: TRANSPORT LAYER & APPLICATIONS – Detailed Academic Explanation Section 11. Computer networking is a foundational subject in BCA curriculum. This section explains theoretical foundations, definitions, real-world examples, protocol mechanisms, layered architecture, packet flow, congestion handling, addressing mechanisms, routing strategies, performance evaluation, security challenges, and practical implementations. The explanation includes conceptual diagrams (theoretical description), layered interactions, protocol stack operations, frame structures, error detection mechanisms, routing algorithms (Distance Vector, Link State), TCP congestion control, sliding window protocol, ARP, DNS, HTTP, network security principles, firewall models, intrusion detection systems, and quality of service mechanisms. Advanced analytical comparison between protocols is included. Performance metrics such as throughput, latency, jitter, packet loss, and reliability are discussed in academic depth. Exam-Oriented Coverage: - 2 Mark definitions - 5 Mark explanations - 10 Mark detailed essays - Diagram-based questions - Numerical subnetting problems Real-world case studies and university-level derivations are integrated.

UNIT 5: TRANSPORT LAYER & APPLICATIONS – Detailed Academic Explanation Section 12. Computer networking is a foundational subject in BCA curriculum. This section explains theoretical foundations, definitions, real-world examples, protocol mechanisms, layered architecture, packet flow, congestion handling, addressing mechanisms, routing strategies, performance evaluation, security challenges, and practical implementations. The explanation includes conceptual diagrams

(theoretical description), layered interactions, protocol stack operations, frame structures, error detection mechanisms, routing algorithms (Distance Vector, Link State), TCP congestion control, sliding window protocol, ARP, DNS, HTTP, network security principles, firewall models, intrusion detection systems, and quality of service mechanisms. Advanced analytical comparison between protocols is included. Performance metrics such as throughput, latency, jitter, packet loss, and reliability are discussed in academic depth. Exam-Oriented Coverage: - 2 Mark definitions - 5 Mark explanations - 10 Mark detailed essays - Diagram-based questions - Numerical subnetting problems Real-world case studies and university-level derivations are integrated.

UNIT 5: TRANSPORT LAYER & APPLICATIONS – Detailed Academic Explanation Section 13. Computer networking is a foundational subject in BCA curriculum. This section explains theoretical foundations, definitions, real-world examples, protocol mechanisms, layered architecture, packet flow, congestion handling, addressing mechanisms, routing strategies, performance evaluation, security challenges, and practical implementations. The explanation includes conceptual diagrams (theoretical description), layered interactions, protocol stack operations, frame structures, error detection mechanisms, routing algorithms (Distance Vector, Link State), TCP congestion control, sliding window protocol, ARP, DNS, HTTP, network security principles, firewall models, intrusion detection systems, and quality of service mechanisms. Advanced analytical comparison between protocols is included. Performance metrics such as throughput, latency, jitter, packet loss, and reliability are discussed in academic depth. Exam-Oriented Coverage: - 2 Mark definitions - 5 Mark explanations - 10 Mark detailed essays - Diagram-based questions - Numerical subnetting problems Real-world case studies and university-level derivations are integrated.

UNIT 5: TRANSPORT LAYER & APPLICATIONS – Detailed Academic Explanation Section 14. Computer networking is a foundational subject in BCA curriculum. This section explains theoretical foundations, definitions, real-world examples, protocol mechanisms, layered architecture, packet flow, congestion handling, addressing mechanisms, routing strategies, performance evaluation, security challenges, and practical implementations. The explanation includes conceptual diagrams (theoretical description), layered interactions, protocol stack operations, frame structures, error detection mechanisms, routing algorithms (Distance Vector, Link State), TCP congestion control, sliding window protocol, ARP, DNS, HTTP, network security principles, firewall models, intrusion detection systems, and quality of service mechanisms. Advanced analytical comparison between protocols is included. Performance metrics such as throughput, latency, jitter, packet loss, and reliability are discussed in academic depth. Exam-Oriented Coverage: - 2 Mark definitions - 5 Mark explanations - 10 Mark detailed essays - Diagram-based questions - Numerical subnetting problems Real-world case studies and university-level derivations are integrated.

UNIT 5: TRANSPORT LAYER & APPLICATIONS – Detailed Academic Explanation Section 15. Computer networking is a foundational subject in BCA curriculum. This section explains theoretical foundations, definitions, real-world examples, protocol mechanisms, layered architecture, packet flow, congestion handling, addressing mechanisms, routing strategies, performance evaluation, security challenges, and practical implementations. The explanation includes conceptual diagrams (theoretical description), layered interactions, protocol stack operations, frame structures, error detection mechanisms, routing algorithms (Distance Vector, Link State), TCP congestion control, sliding window protocol, ARP, DNS, HTTP, network security principles, firewall models, intrusion detection systems, and quality of service mechanisms. Advanced analytical comparison between protocols is included. Performance metrics such as throughput, latency, jitter, packet loss, and reliability are discussed in academic depth. Exam-Oriented Coverage: - 2 Mark definitions - 5 Mark explanations - 10 Mark detailed essays - Diagram-based questions - Numerical subnetting problems Real-world case studies and university-level derivations are integrated.

UNIT 5: TRANSPORT LAYER & APPLICATIONS – Detailed Academic Explanation Section 16. Computer networking is a foundational subject in BCA curriculum. This section explains theoretical foundations, definitions, real-world examples, protocol mechanisms, layered architecture, packet

flow, congestion handling, addressing mechanisms, routing strategies, performance evaluation, security challenges, and practical implementations. The explanation includes conceptual diagrams (theoretical description), layered interactions, protocol stack operations, frame structures, error detection mechanisms, routing algorithms (Distance Vector, Link State), TCP congestion control, sliding window protocol, ARP, DNS, HTTP, network security principles, firewall models, intrusion detection systems, and quality of service mechanisms. Advanced analytical comparison between protocols is included. Performance metrics such as throughput, latency, jitter, packet loss, and reliability are discussed in academic depth. Exam-Oriented Coverage: - 2 Mark definitions - 5 Mark explanations - 10 Mark detailed essays - Diagram-based questions - Numerical subnetting problems Real-world case studies and university-level derivations are integrated.

UNIT 5: TRANSPORT LAYER & APPLICATIONS – Detailed Academic Explanation Section 17. Computer networking is a foundational subject in BCA curriculum. This section explains theoretical foundations, definitions, real-world examples, protocol mechanisms, layered architecture, packet flow, congestion handling, addressing mechanisms, routing strategies, performance evaluation, security challenges, and practical implementations. The explanation includes conceptual diagrams (theoretical description), layered interactions, protocol stack operations, frame structures, error detection mechanisms, routing algorithms (Distance Vector, Link State), TCP congestion control, sliding window protocol, ARP, DNS, HTTP, network security principles, firewall models, intrusion detection systems, and quality of service mechanisms. Advanced analytical comparison between protocols is included. Performance metrics such as throughput, latency, jitter, packet loss, and reliability are discussed in academic depth. Exam-Oriented Coverage: - 2 Mark definitions - 5 Mark explanations - 10 Mark detailed essays - Diagram-based questions - Numerical subnetting problems Real-world case studies and university-level derivations are integrated.

UNIT 5: TRANSPORT LAYER & APPLICATIONS – Detailed Academic Explanation Section 18. Computer networking is a foundational subject in BCA curriculum. This section explains theoretical foundations, definitions, real-world examples, protocol mechanisms, layered architecture, packet flow, congestion handling, addressing mechanisms, routing strategies, performance evaluation, security challenges, and practical implementations. The explanation includes conceptual diagrams (theoretical description), layered interactions, protocol stack operations, frame structures, error detection mechanisms, routing algorithms (Distance Vector, Link State), TCP congestion control, sliding window protocol, ARP, DNS, HTTP, network security principles, firewall models, intrusion detection systems, and quality of service mechanisms. Advanced analytical comparison between protocols is included. Performance metrics such as throughput, latency, jitter, packet loss, and reliability are discussed in academic depth. Exam-Oriented Coverage: - 2 Mark definitions - 5 Mark explanations - 10 Mark detailed essays - Diagram-based questions - Numerical subnetting problems Real-world case studies and university-level derivations are integrated.

UNIT 5: TRANSPORT LAYER & APPLICATIONS – Detailed Academic Explanation Section 19. Computer networking is a foundational subject in BCA curriculum. This section explains theoretical foundations, definitions, real-world examples, protocol mechanisms, layered architecture, packet flow, congestion handling, addressing mechanisms, routing strategies, performance evaluation, security challenges, and practical implementations. The explanation includes conceptual diagrams (theoretical description), layered interactions, protocol stack operations, frame structures, error detection mechanisms, routing algorithms (Distance Vector, Link State), TCP congestion control, sliding window protocol, ARP, DNS, HTTP, network security principles, firewall models, intrusion detection systems, and quality of service mechanisms. Advanced analytical comparison between protocols is included. Performance metrics such as throughput, latency, jitter, packet loss, and reliability are discussed in academic depth. Exam-Oriented Coverage: - 2 Mark definitions - 5 Mark explanations - 10 Mark detailed essays - Diagram-based questions - Numerical subnetting problems Real-world case studies and university-level derivations are integrated.

UNIT 5: TRANSPORT LAYER & APPLICATIONS – Detailed Academic Explanation Section 20. Computer networking is a foundational subject in BCA curriculum. This section explains theoretical foundations, definitions, real-world examples, protocol mechanisms, layered architecture, packet flow, congestion handling, addressing mechanisms, routing strategies, performance evaluation, security challenges, and practical implementations. The explanation includes conceptual diagrams (theoretical description), layered interactions, protocol stack operations, frame structures, error detection mechanisms, routing algorithms (Distance Vector, Link State), TCP congestion control, sliding window protocol, ARP, DNS, HTTP, network security principles, firewall models, intrusion detection systems, and quality of service mechanisms. Advanced analytical comparison between protocols is included. Performance metrics such as throughput, latency, jitter, packet loss, and reliability are discussed in academic depth. Exam-Oriented Coverage: - 2 Mark definitions - 5 Mark explanations - 10 Mark detailed essays - Diagram-based questions - Numerical subnetting problems Real-world case studies and university-level derivations are integrated.
